## ThermalWood Canada

Bathurst, New Brunswick

ThermalWood Canada offers high-quality thermally modified wood products for a wide range of indoor and outdoor applications. ThermalWood is manufactured using an innovative method developed in Finland. No chemicals are used in the treatment, resulting in an environmentally friendly product. The thermally-modified wood production takes place in a 46,000 sq foot facility located in the Bathurst Industrial Park.

ThermalWood has processed a variety of wood species but they pride themselves on the expertise that has been developed over multiple years with hardwoods. When used for outdoor materials, the life expectancy is considerably higher than that of non-thermally modified wood, reducing the frequency of maintenance and replacement of installations such as decking.

Recently, ThermalWood Canada has started supplying the music industry with blanks for guitar necks, finger boards and bodies.

### Highlights from ThermalWood's nomination

ThermalWood Canada prides itself on its ability to manufacture high quality, long lasting and environmentally friendly wood products using innovative technologies.

Currently, their products are FSC and Rain Forest Alliance-certified. They also make their facility available for anyone looking to start a new company/product that delivers value added wood products.

In addition, they are very engaged in giving back to the region's youth, offering them training and mentorship opportunities.
